CITATION: Frey, L.T., et al. 1999. Mallard Duck Dietary Reproduction Toxicity Study. Unpublished study performed by Wildlife International Ltd., Easton, MD. Laboratory Project No. 312-115. Study sponsored by Hoechst Schering AgriEvo GmbH, Frankfurt am Main, Germany. Study initiated May 19, 1998 and completed August 17, 1999.

2013031

EXECUTIVE SUMMARY:

The one-generation reproductive toxicity of AE F130060 Technical (Mesosulfuron-methyl) to groups (16 pens/treatment level) of 1 male and 1 female, 24-week-old Mallard duck was assessed over approximately 21 weeks. AE F130060 Technical was administered to the birds in the diet at mean-measured concentrations of <1 (LOD, negative control), 38, 180, or 990 ppm a.i.

There was a significant reduction in the ratio of live embryos to viable embryos at the lowest treatment group. No other significant treatment-related effects on any adult or offspring parameter were detected. However, because a reproductive parameter was adversely affected, the NOEC could not be determined in this study (<38 ppm).

This toxicity study is scientifically sound. However, because the lowest concentration elicited an adverse effect on a reproductive parameter (i.e., ratio of live embryos to viable embryos), a NOEC was not established. This study is therefore classified as SUPPLEMENTAL and it does not fulfill the US EPA guideline requirement (§71-4) for a reproductive toxicity study with mallard duck.

Results Synopsis

Test Organism Size/Age: 24 weeks old at test initiation (845-1301 g)

NOEC: <38 ppm

LOEC: 38 ppm

Endpoint(s) Affected: ratio of live embryos to viable embryos

I. MATERIALS AND METHODS

GUIDELINE FOLLOWED: The study protocol was based on procedures of the U.S. EPA Pesticide Assessment Guidelines, Subsection 71-4 (1982); OECD Guideline 206 (1984); and ASTM Standard E1062-86 (1986). Deviations from §71-4 are:

1. Mortality of the ducks during acclimation was not described.
2. The photo-period was 6 hours light/day up through Week 10, instead of 7 hours light/day up through Week 8.
3. The average egg storage temperature (prior to setting for incubation) was $13.3 \pm 0.3^{\circ}\text{C}$, slightly lower than the recommended level of 16°C .
4. The average temperature during hatching was $37.2 \pm 0.0^{\circ}\text{C}$, slightly lower than the recommended temperature of 39°C . The photo-period during hatching was not specified.
5. The number of normal hatchlings was not monitored, and the health of the chicks during the 14-day maintenance period was not specified.
6. Raw data pertaining to clinical effects observed in parental ducks and hatchlings were not provided.

These deviations did not affect the scientific validity of the study; however, this study does not fulfill guideline requirements.

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

6. The number of normal hatchlings was not monitored, and the health of the chicks during the 14-day maintenance period was not specified.
7. Raw data pertaining to clinical effects observed in parental ducks and hatchlings were not provided.

These deviations did not affect the scientific validity of the study; however, this study does not fulfill guideline requirements.

COMPLIANCE:

Signed and dated GLP, Quality Assurance, and Data Confidentiality statements were provided. This study was conducted in accordance with United States, OECD, and Japan MAFF GLP standards (p. 3).

A. MATERIALS:

1. Test Material AE F130060 Technical

Description: Light beige powder

Lot No./Batch No.: Pfl. 35316

Purity: 94.6% (w:w)

Stability of Compound

Under Test Conditions: The stability of AE F130060 Technical was assessed in the treated feed prepared at all test levels after 7 days of ambient storage and 4 weeks of frozen storage. Recoveries averaged 94-103% of initial values after 7 days of ambient storage and 106-113% of initial values after 4 weeks of frozen storage (reviewer-calculated from mean recoveries provided in table on p. 118).

Storage conditions

of test chemical: At ambient temperature under locked storage.

OECD requires water solubility, stability in water and light, pK_a , P_{ow} , and vapor pressure of the test compound. OECD requirements were not reported.

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

2. Test organism:

Table 1: Test organism.

Parameter	Details	Remarks
		Criteria
Species (common and scientific names):	Mallard duck (<i>Anas platyrhynchos</i>)	<i>EPA requires: a wild waterfowl species, preferably the mallard, Anas platyrhynchos, or an upland game species, preferably the northern bobwhite, Colinus virginianus.</i>
Age at Study Initiation:	24 weeks	<i>It was stated that birds were approaching their first breeding season.</i> <i>EPA requires: birds should be approaching their first breeding season.</i>
Body Weight: (mean and range)	Males: Overall range (n=64) 961 to 1301 g, with group means of 1102 to 1125 g. Females: Overall range (n=64) 845 to 1107 g, with group means of 966 to 1010 g.	Individual body weights were recorded at Weeks 0, 2, 4, 6, 8 and 21 (test termination). <i>EPA requires that body weights should be recorded at test initiation and at biweekly intervals up to week eight or up to the onset of egg laying and at termination.</i>
Source:	Whistling Wings, Inc. Hanover, IL.	Birds were from the same hatch, and were phenotypically indistinguishable from wild birds. <i>EPA requires that all birds should be from the same source.</i>

EPA MRID Number 45386229

B. STUDY DESIGN:

1. Experimental Conditions

- a. Range-finding Study - None conducted.
- b. Definitive Study

Table 2: Experimental Parameters.

Parameter	Details	Remarks
		Criteria
Acclimation period:	10 weeks	The study author reported that at test initiation, all birds were examined for physical injuries and general health, and birds that did not appear healthy were excluded from the study.
Conditions (same as test or not):	Same as test	
Feeding:	Water and feed were provided <i>ad libitum</i> .	
Health (any mortality observed):	Pre-test mortality was not reported.	Mallard were fed a basal diet formulated by Agway Inc., to meet laboratory specifications (Appendix XIV, p. 141), and provided public tap water from the city of Easton. Results from periodic analysis of the feed and water for pesticides, organics, metals, and other inorganics are provided in Appendix XV, pp. 142-143.
		<i>EPA recommends a 2-3 week health observation period prior to selection of birds for treatment. Birds must be generally healthy without excess mortality. Feeding should be <u>ad libitum</u>, and sickness, injuries or mortality be noted.</i>

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

Parameter	Details	Remarks
		<i>Criteria</i>
Test duration pre-laying exposure:	Approximately 10 weeks	
egg-laying exposure:	Approximately 11 weeks	<i>EPA requires</i> <u>Pre-laying exposure duration</u> <i>At least 10 weeks prior to the onset of egg-laying.</i>
withdrawal period, if used:	None	<u>Exposure duration with egg-laying</u> <i>At least 10 weeks.</i> <u>Withdrawal period</u> <i>If reduced reproduction is evident, a withdrawal period of up to 3 weeks should be added to the test phase.</i>

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

Parameter	Details	Remarks
		Criteria
Pen (for parental and offspring) size:	Parents (one pair) were housed in 75- x 90- x 45-cm battery pens. Offspring (by set and group) were housed in 62- x 92- x 25.5-cm battery brooders.	<u>Pens</u> Adequate room and arranged to prevent cross contamination <u>Materials</u> Nontoxic material and nonbinding material, such as galvanized steel. <u>Number</u> At least 5 replicate pens are required for mallards housed in groups of 7. For other arrangements, at least 12 pens are required, but considerably more may be needed if birds are kept in pairs. Chicks are to be housed according to parental grouping.
construction materials:	Vinyl-coated wire mesh (both parental and offspring).	
number:	16 parental pens/treatment level	
Number of birds per pen (male:female)	2 birds/pen (1 male:1 female)	EPA requires one male and 1 female per pen. For quail, 1 male and 2 females is acceptable. For ducks, 2 males and 5 females is acceptable.
Number of pens per group/treatment negative control: solvent control: treated:	16 pens N/A 16 pens/treatment	EPA requires at least 12 pens, but considerably more if birds are kept in pairs. At least 16 is strongly recommended.

PMRA Submission Number

EPA MRID Number 45386229

Parameter	Details	Remarks
		Criteria
Test concentrations (ppm diet) nominal: measured:	0, 40, 200, or 1000 ppm <1 (LOD), 38, 180, or 990 ppm a.i.	<p>Mean-measured concentrations were reviewer-calculated from data provided in the table on p. 118. Samples for all test levels were collected from treated feed prepared for Weeks 1, 8, 12, and 20 [Weeks 1 (Day 7) and 4 were for stability purposes].</p> <p>Nominal concentrations were selected by the Sponsor based on toxicity data obtained from the LD₅₀ in the Mallard, sub-chronic feeding studies in rodents and non-rodents, the initial Estimated Environmental Concentration (EEC) at the maximum application rate (not specified), and the OECD testing guideline for such studies (pp. 15-16).</p> <p><i>EPA requires at least two concentrations other than the control are required; three or more are recommended.</i></p>
Maximum labeled field residue anticipated and source of information:	Not specified	<p>It was reported (p. 8 of the companion avian reproduction study, MRID 45386228) that 1000 ppm is the limit concentration according to relevant OECD testing guidelines.</p> <p><i>EPA requires that the highest test concentrations should show a significant effect or be at or above the actual or expected field residue level. The source [i.e., maximum label rate (in lb ai/A & ppm), label registration no., label date, and site should be cited]</i></p>

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

Parameter	Details	Remarks
		Criteria
Solvent/vehicle, if used type: amount:	None used.	<i>EPA requires corn oil or other appropriate vehicle not more than 2% of diet by weight</i>
Was detailed description and nutrient analysis of the basal diet provided? (Yes/No)	Yes	Basal diets contained ≥27% protein, ≥2.5% fat, ≤5% fiber, and 5% limestone (p. 14). Offspring received basal diet without the addition of test substance or limestone. <i>EPA requires a commercial breeder feed (or its equivalent) that is appropriate for the test species.</i>
Preparation of test diet	The appropriate amount of sifted (600 µm) AE F130060 Technical was blended with a portion of basal ration for 1 minute in a Waring blender (Appendix XII, p. 111). The mixture was transferred to a Hobart mixer bowl containing additional basal ration and mixed for approximately 15 minutes. Separate pre-mixes were prepared for each concentration level approximately every 3-4 weeks, and were stored frozen until needed. Final diets were prepared weekly. The pre-mixes were combined with additional basal ration and limestone and mixed for approximately 20 minutes in a Patterson-Kelly twin shell dry blender prior to offering.	<i>A premixed containing the test substance should be mechanically mixed with basal diet. If an evaporative vehicle is used, it must be completely evaporated prior to feeding.</i>
Indicate whether stability and homogeneity of test material in diet determined (Yes/No)	Yes	

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

Parameter	Details	Remarks
		Criteria
Were concentrations in diet verified by chemical analysis?	Yes	Samples were analyzed from feed prepared during Weeks 1, 8, 12, and 20 [Weeks 1 (Day 7) and 4 were for stability purposes; Table on p. 118].
Did chemical analysis confirm that diet was stable? and homogeneous?	Yes Yes	The stability of AE F130060 Technical was assessed in the treated feed prepared at all test levels after 7 days of ambient storage and 4 weeks of frozen storage. Recoveries averaged 94-103% of initial values after 7 days of ambient storage and 106-113% of initial values after 4 weeks of frozen storage (reviewer-calculated from mean recoveries provided in table on p. 118). The homogeneity of AE F130060 Technical was assessed in the treated feed prepared at all test levels; duplicate samples were collected from the top, middle, and bottom of batches prepared for Week 1. Coefficients of Variation were 2.0% for the 40 ppm level, 4.0% for the 200 ppm level, and 7.9% for the 1000 ppm level (reviewer-calculated from individual data provided on p. 129).
Feeding and husbandry	Feeding and husbandry conditions appeared to be adequate, given guideline recommendations.

PMRA Submission Number

EPA MRID Number 45386229

Parameter	Details	Remarks
		Criteria
Test conditions (pre-laying) temperature:	$21.7 \pm 2.6^{\circ}\text{C}$	Light intensity ranged from 335 ± 118 lux. Illumination was provided by fluorescent lights which closely approximated noon-day sunlight.
relative humidity:	$62 \pm 19\%$	
photo-period:	6 hr light/day up through Week 10; 17 hr light/day thereafter.	<p>EPA Requires Temperature: About 21°C (70°F)</p> <p>Relative humidity: About 55%</p> <p>Lighting</p> <p><u>First 8 weeks:</u> 7 h per day. <u>Thereafter:</u> 16-17 h per day. At least 6 foot candles at bird level.</p>
Egg Collection and Incubation		
Egg collection and storage collection interval:	Daily	To prevent pathogen contamination, the collected eggs were washed in a commercial egg washer with a chlorine-based detergent at 46°C for approximately 3 minutes. The washed eggs were allowed to cool to approximately room temperature and rinsed with fresh water prior to storage.
storage temperature:	$13.3 \pm 0.3^{\circ}\text{C}$	
storage humidity:	$69 \pm 12\%$	EPA requires eggs to be collected daily; egg storage temperature approximately 16°C (61°F); humidity approximately 65%.
Were eggs candled for cracks prior to setting for incubation?	Yes	EPA requires eggs to be candled on day 0
Were eggs set weekly?	Yes	
Incubation conditions temperature:	$37.5 \pm 0.1^{\circ}\text{C}$	
humidity:	Approximately 56%	

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

Parameter	Details	Remarks
		Criteria
When candling was done for fertility?	Days 14 or 15 for fertility and Day 20 for viability.	EPA requires: Quail: approx. day 11 Ducks: approx. day 14
When the eggs were transferred to the hatcher?	Day 24	EPA requires: Bobwhite: day 21 Mallard: day 23
Hatching conditions temperature:	37.2 ± 0.0°C	
humidity:	Approximately 76%	EPA requires: temperature of 39°C (102°F) humidity of 70%
photoperiod:	Not specified	
Day the hatched eggs were removed and counted	Days 27 or 28	EPA requires Bobwhite: day 24 Mallard: day 27
Were egg shells washed and dried for at least 48 hrs before measuring?	Yes, shells were washed and air-dried for at least 1 week.	
Egg shell thickness no. of eggs used:	One egg was collected (when available) from each odd numbered cage during odd numbered weeks and from each even numbered cage during the even numbered weeks.	
intervals:	Once weekly throughout the egg laying period.	EPA requires newly hatched eggs be collected at least once every two weeks. Thickness of the shell plus membrane should be measured to the nearest 0.01 mm; 3 - 4 measurements per shell.
mode of measurement:	Five points around the equatorial circumference were measured to the nearest 0.002 mm.	
Reference chemical, if used	None used

2. Observations:

Table 3: Observations.

Parameter	Details	Remarks/Criteria
Parameters measured		
Parental: (mortality, body weight, mean feed consumption)	- mortality - body weight - food consumption - signs of toxicity - necropsy	
Egg collection and subsequent development: (no. of eggs laid, no. of eggs cracked, shell thickness, no. of eggs set, no. of viable embryos, no. of live 3 week embryos, no. hatched, no. of 14-day survivors, average weight of 14-day-old survivors, mortality, gross pathology, others)	- eggs laid - eggs cracked - eggshell thickness - eggs set - viable embryos - live 3-week embryos - number of hatchlings - hatchling body weight - number of 14-day-old survivors - 14-day-old survivor body weight	<p>EPA requires:</p> <ul style="list-style-type: none"> • Eggs laid/pen • Eggs cracked/pen • Eggs set/pen • Viable embryos/pen • Live 3-week embryos/pen • Normal hatchlings/pen • 14-day-old survivors/pen • 14-day-old survivors/pen • Weights of 14-day-old survivors (mean per pen) • Egg shell thickness • Food consumption (mean per pen) • Initial and final body weight (mean per pen)
Indicate if the test material was regurgitated	No indications of dietary regurgitation.	
Observation intervals (for various parameters)	Parental: mortality and signs of toxicity were recorded once daily; body weights were recorded at Weeks 0, 2, 4, 6, 8 and 21 (test termination); and food consumption was determined weekly. Offspring survival was monitored daily. and body weights were recorded at 0 and 14 days.	<p>Body weights and food consumption must be measured at least biweekly.</p>
Were raw data included?	Yes, sufficient.	

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

I. RESULTS AND DISCUSSION:

A. MORTALITY:

No mortality occurred during the 21-week study (p. 22).

Table 4: Effect of AE F130060 Technical on Mortality of *Anas Platyrhynchos*.

Treatment, ppm measured (and nominal) concentrations	Observation Period					
	Week 7		Week 14		Week 21	
	No. Dead Male	No. Dead Female	No. Dead Male	No. Dead Female	No. Dead Male	No. Dead Female
Control	0	0	0	0	0	0
38 (40)	0	0	0	0	0	0
180 (200)	0	0	0	0	0	0
990 (1000)	0	0	0	0	0	0

B. REPRODUCTIVE AND OTHER ENDPOINTS:

Abnormal Effects/Behavior: No clinical signs of toxicity were observed (p. 22). Incidental clinical observations normally associated with pen wear and/or interactions among pen mates were observed and included foot lesions, leg swelling, feather loss, lameness, and lower limb weakness. Raw data pertaining to clinical effects observed in parental ducks were not provided.

Food Consumption: No treatment-related effects on food consumption were observed (Table 2; p. 28). A statistically-significant decrease in mean feed consumption was observed during Week 16 at the 40 ppm level compared to the control group. However, since the difference was observed at the lowest test group and was no consistent over time, it was not considered to be related to treatment. Overall feed consumption averaged 145.6 g/bird/day for the control group, and 130.0, 143.0, and 141.4 g/bird/day for the 40, 200, and 1000 ppm test groups, respectively.

Body Weight: No treatment-related effects on body weight were observed (Table 1, p. 27). A slight statistically-significant increase in body weight was observed in males from the 1000 ppm group at test termination compared to the control group. Since the difference was slight (<10%) and represented an increase in body weight, it was considered not to be treatment-related.

Necropsy: All necropsy findings were considered incidental to treatment (Table 4, pp. 30-31).

Reproductive Effects: No treatment-related effects on egg production, fertility, embryonic development, or hatchability were observed (Tables 5-7, pp. 32-34). A slight statistically-significant reduction in the percentage of live 3-week embryos/viable embryos was observed at the 40 ppm group compared to the control (98 versus 100%). The study authors noted that this slight difference was primarily due to exceptional performance by the control group, and that since the percentage of live 3-week embryos was consistent with the historical control

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

value of 98%, and the reduction was not concentration-dependent, that the difference was not considered to be treatment-related (pp. 23-24). A slight statistically-significant reduction in the percentage of hatchlings/live 3-week embryos was observed at the 40 ppm group compared to the control (76 versus 93%). The study authors noted that, again, this difference was primarily due to the exceptional performance by the control group, and that since the hatchability was comparable to the historical control value of $73 \pm 13\%$, and the reductio was not concentration-dependent, that the difference was not considered to be treatment-related (p. 24).

The health of the hatchlings during the 14-day maintenance period was not monitored. No treatment-related effects on hatchling or 14-day old chick body weights were observed (Table 8, p. 35).

Table 5: Reproductive and other parameters (study author-reported).

Parameter	Control	40 ppm	200 ppm	1000 ppm	NOEC/ LOEC

N/A = Not statistically-analyzed.

* Statistically different from the control at p<0.05.

** Statistically different from the control at p<0.01.

C. REPORTED STATISTICS:

The following variables were statistically analyzed: adult body weight, adult feed consumption, eggs laid of maximum laid, eggs cracked of eggs laid, viable embryos of eggs set, live 3-week embryos of viable embryos, hatchlings of 3-week embryos, 14-day old survivors of hatchlings, hatchlings of eggs set, 14-day old survivors of eggs set, hatchlings of maximum set, 14-day old survivors of maximum set, egg shell thickness, and offspring's body weight.

An analysis of variance (ANOVA) was performed to determine statistically-significant differences between groups. Dunnett's multiple comparison procedure was then used to compare the treatment means with the control group mean. Sample units were the individual pens within each experimental group, except adult body weights, where the sample unit was the individual bird. Percentage data were examined using Dunnett's method following arcsine square root transformation. Nominal concentrations were used for all estimations.

EPA MRID Number 45386229

D. VERIFICATION OF STATISTICAL RESULTS:

Statistical Method: Analysis was conducted using "chicks.sas" (Ver. 3; March 2002), a SAS program provided by EFED/OPP/USEPA. Data for all endpoints were examined graphically using box plots to determine if they exhibited a dose-dependent response, which was ultimately used to select the multiple comparison test to detect LOAEC and NOAEC. Data for each endpoint were tested to determine if their distributions were normal and if their variances were homogeneous using Shapiro-Wilk's and Levene's tests, respectively. Data that satisfied these assumptions were subjected to Dunnett's and William's tests and data that did not satisfy these assumptions were subjected to the nonparametric MannWhitney-U (with a Bonferroni adjustment) and Jonckheere's tests. Data for dead birds were excluded from the analyses. See Appendix I for output of reviewer's statistical verification and graphs for affected endpoints to support any reviewer-generated conclusions that may differ from those reported in the study.

The reviewer's analysis detected a significant reduction in the ratio of live embryos to viable embryos at the lowest treatment group.

Table 6. Reproductive and other parameters (reviewer-reported).

Parameter	Control	38 ppm	180 ppm	990 ppm	NOEC/ LOEC

Survivor weight (g)	262.6	270.7	271.8	274.1	990 ppm >990 ppm
Mean food consumption (g/bird/day)	145.8	129.9	142.7	141.4	990 ppm >990 ppm
Male weight gain (g)	78.9	81.9	118.1	182.9	990 ppm >990 ppm
Female weight gain (g)	210.6	241.9	224.9	246.2	990 ppm >990 ppm

E. STUDY DEFICIENCIES:

This study is considered scientifically valid, and the deficiencies listed were generally considered minor by the reviewer. However, since the study was conducted at concentrations that did not elicit an adverse effect, and since the maximum labeled field residue was not provided, it is unknown if the highest level tested was at an appropriate level to approximate field exposure for this species. Therefore, this study does not fulfill guideline requirements for the reproductive toxicity of AE F130060 Technical (Mesosulfuron-methyl) to the Mallard duck (\$71-4b).

F. REVIEWER'S COMMENTS:

Results of the reviewer's statistical analyses were nearly identical to those of the study author. Both the reviewer's and the study author's analyses detected a significant reduction in the ratio of live embryos to viable

Data Evaluation Report on the Reproductive Effects of AE F130060 Technical on Avian Species *Anas platyrhynchos*

PMRA Submission Number

EPA MRID Number 45386229

embryos at the lowest treatment group; the study author dismissed this adverse effect, attributing it to exceptional performance in the control group. Because response in the lowest treatment group was lower than the control and remaining treatment groups, the reviewer considered the response to be biologically significant. As a result, the reviewer concluded that a NOEC could not be determined in this study (<38 ppm).

Based on mean feed consumption, the study author calculated a mean test substance intake of 4.6, 25.8, and 126 mg/kg bw/day for the 40, 200, and 1000 ppm groups, respectively (Table 3, p. 29).

On Day 1 of the test, a female from the 1000 ppm group began producing eggs. This hen was promptly replaced with a comparable female from the group of birds that had been acclimated with the test birds, and all data provided in the study were from the replacement bird (p. 13).

G. CONCLUSIONS:

This study is scientifically sound, but does not fulfill guideline requirements because the lowest concentration tested elicited an adverse effect on a reproductive parameter. A subsequent NOEC was not established. This study is therefore classified as SUPPLEMENTAL.

NOEC: <38 ppm

LOEC: 38 ppm

Endpoint(s) Affected: ratio of live embryos to viable embryos

ANALYSIS RESULTS FOR VARIABLE FOOD (Food Consumption)

TESTS OF ASSUMPTIONS FOR PARAMETRIC ANALYSIS

Shapiro-Wilks test for Normality of Residuals -- alpha-level=0.01

Levenes test for homogeneity of variance (absolute residuals) -- alpha-level=0.05

Use parametric analyses if neither test rejected, otherwise non-parametric analyses.

Page ____ is not included in this copy.

Pages 4 through 13 are not included in this copy.

The material not included contains the following type of information:

- Identity of product inert ingredients.
- Identity of product impurities.
- Description of the product manufacturing process.
- Description of quality control procedures.
- Identity of the source of product ingredients.
- Sales or other commercial/financial information.
- A draft product label.
- The product confidential statement of formula.
- Information about a pending registration action.
- FIFRA registration data.
- The document is a duplicate of page(s) _____.
- The document is not responsive to the request.

The information not included is generally considered confidential by product registrants. If you have any questions, please contact the individual who prepared the response to your request.
